

# Title: Health Care Indicator Map for Coimbatore District

# Map description and analysis

## Introduction:

Coimbatore, “the Manchester of Tamil Nadu” is located in the longitude of 76.9558° E & latitude of 11.0168° N. It consists of 6 Taluks with wide range of road and railway network as per available data.

## ISRO/Open Source Data:

- Boundary : Divagis
- Features : mapcruzin.com
- Other Data : Bhuvan, National Health Mission, data.gov.in, Mosdoc, Vedas

## Specific Steps in GIS:

- Data Collection and Processing – A complete information about numbers and availability of Health centers in the region was collected from online as well as real time surveys.
- Inclusion of Attributes and Features – Necessary details were added as attributes for further processing and analysis
- Spatial Query : Attributes & Location Query were assigned as inputs for gathering required information
- Layout Creation and Output export – Final maps were generated.

## Complexity:

- Implementation and data extraction of various data available in different formats was time consuming.
- A large set of data added to a larger area makes it difficult to present a visible and high quality output with high precision.

## Potential Application:

- In a gridlocked metropolitan city, this map enables to track down nearby hospitals and blood banks during any accidents and emergency situation which in turn saves many lives .
- The information from these maps locating hospitals and other health centers will be highly useful to give appropriate treatment to people during any outbreak of disaster or a pandemic or endemic situations.
- The information about pharmacies/hospitals/blood banks near the bus stands, railway stations and road networks could be obtained which in turn reduces travelling time
- Requirements for health centres in scarce areas could be identified as per health care data and can be used for developing new health centres in required places.
- By creating more queries, with adding actual data, many more information can be obtained in a very effective and useful manner for enhanced development.
- A mobile application/website can be developed using this information which may enable people to track information about the availability of health centres, shortest commute to a clinic/blood bank during emergency as well as according to their needs.
